

Screen Sketches

Team 2_az_5:
Olivia Blais, Ryan Hoefer,
Rishita Kollu, Eli Johnson

Inventory Manager

Actors

1. Admin/Manager
 - a. Add scheduled shipments
 - b. Add/Remove Employees
 - c. Schedule and modify shipments
 - d. Correct inventory
 - e. Full access to inventory data
2. Employee
 - a. Able to add and delete inventory entries
 - b. View Finances
 - c. View the inventory and its statistics
 - d. Punch in and out
 - e. Search inventory
 - f. View inventory history
3. Accountant
 - a. View cost change information
 - b. Export financial records
 - c. View shipment costs
4. Outside Organization
 - a. View delivery records related to their shipments
 - b. Download shipment history report
 - c. Make queries regarding their shipments

Non-Functional Requirements

1. Secure users' passwords with hashing and SSN using Argon-2 encryption
2. Display database query results returned in less than 1 second
3. Application supports a minimum of 10 current active users without performance issues
4. Display the database info in an easily readable manner and meet WCAG 2.1 Level AA accessibility standards
5. Screen transitions and navigation are complete within 300 milliseconds without visible lag

Tables and Fields

Inventory: has all the info for the inventory to be managed

- Sku number - primary key
- Item name
- Item Description
- Number of Items
- Shipment time: foreign key to shipment table

Inventory Change: a change of the inventory initiated by an employee, for history purposes

- Change ID - primary key
- Sku number - foreign key to inventory table
- Amount
- Employee id - foreign key to employee table

Employee: Stores the account information of the employee

- Employee Id - primary key
- User name
- User email
- Hashed password
- active

Permissions: permission object storage

- Permission ID -primary key
- Employee id - foreign key to employee table
- Permission level
- Date granted
- Date revoked

Privileges: the general perms the user has.

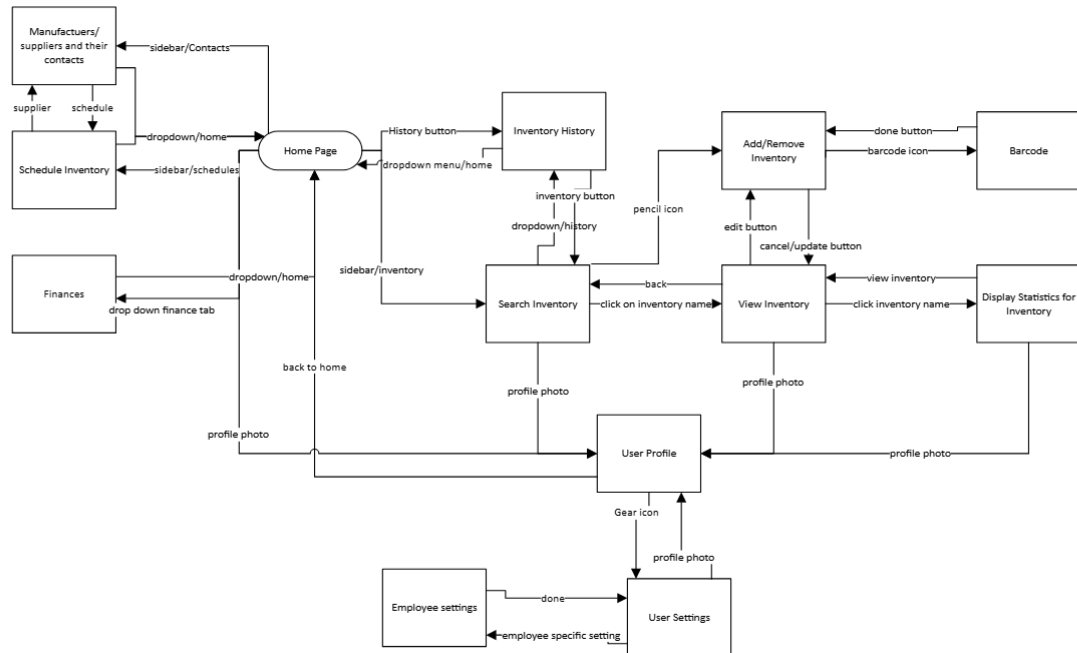

- Permission record id - primary key
- Employee id - foreign key to employee table
- Privilege
- Date granted
- Date revoked
-

Shipment: the shipment time to schedule shipments

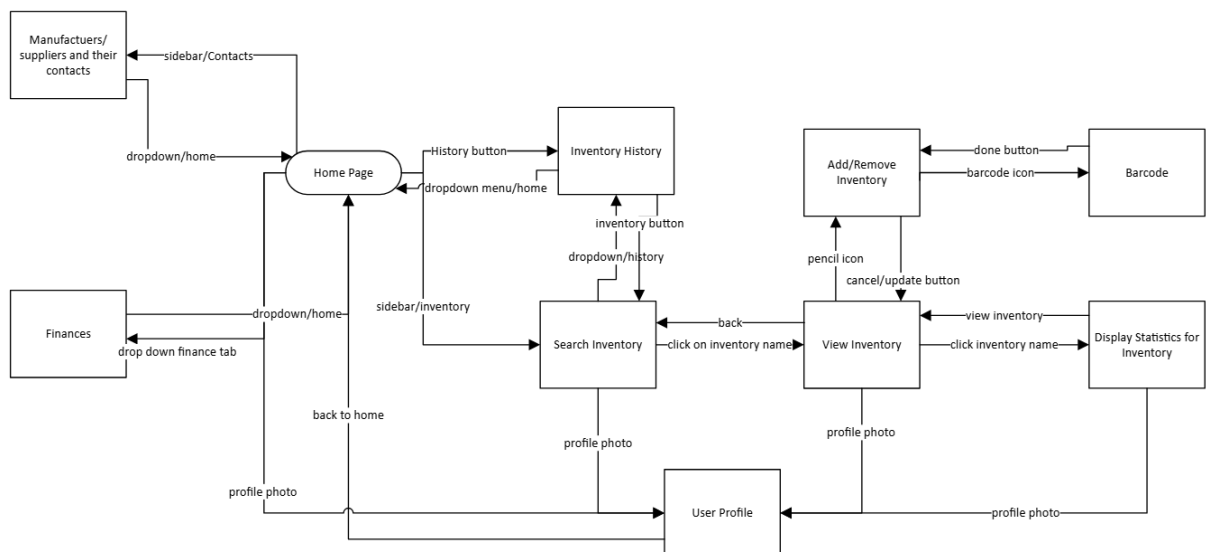

- Shipment ID - primary key
- Expected Date
- Sku Number - foreign key to inventory table

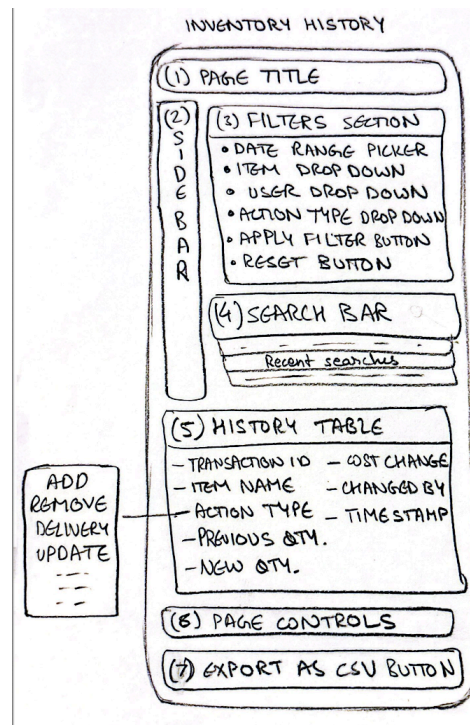

Screen Flow Diagrams

- Admin screens

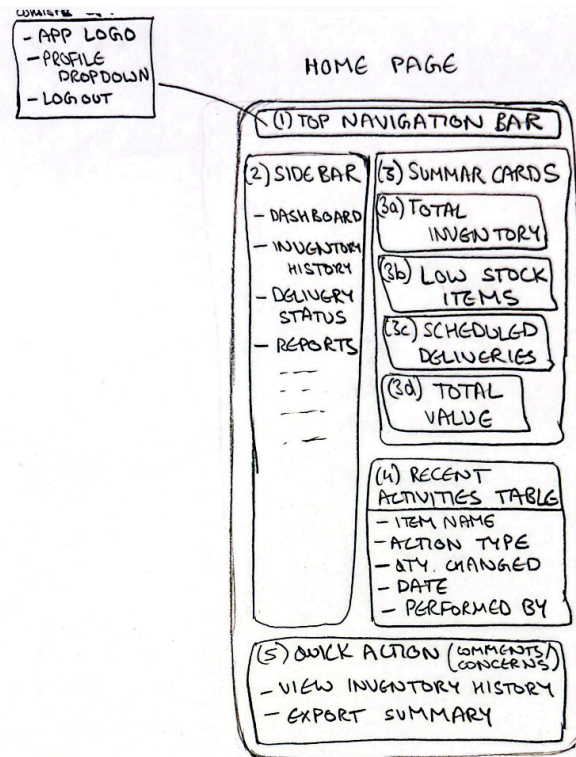

- Employee screens

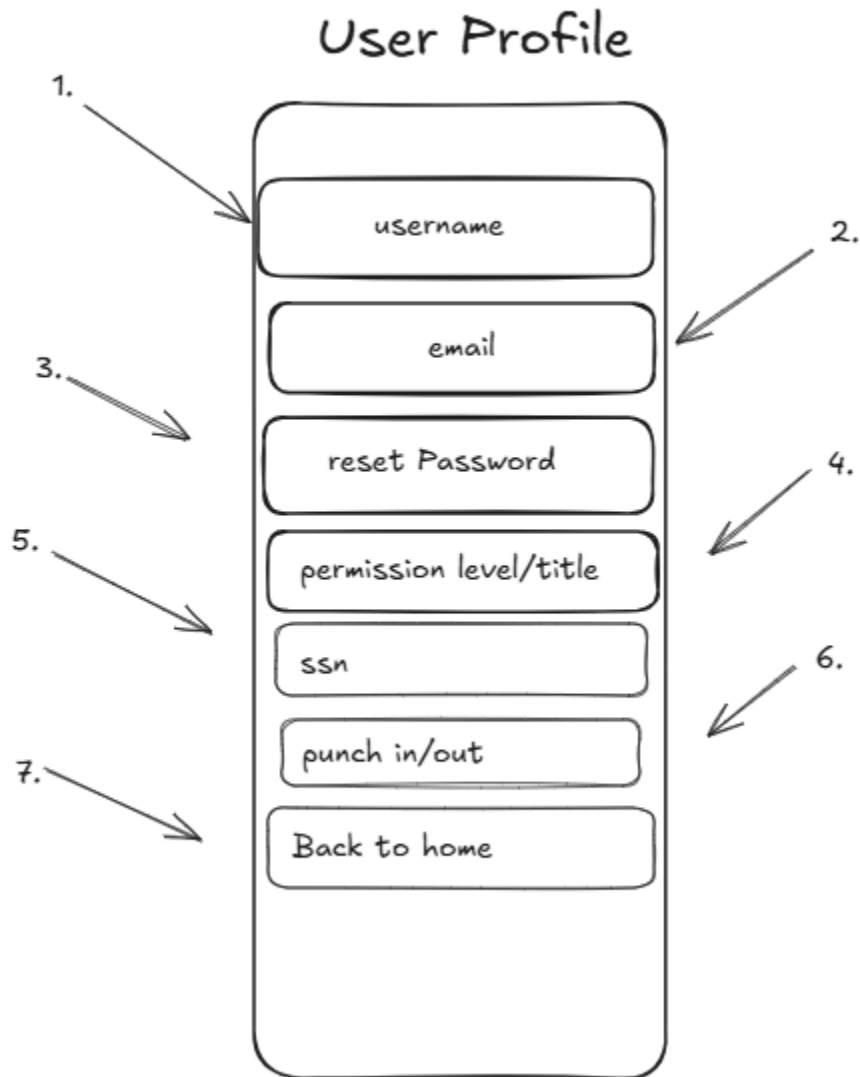

The Inventory History screen allows users to view detailed records of all inventory-related actions in the system.

- Page Title (1)
 - Displays the title “Inventory History” at the top of the page.
- Sidebar (2)
 - the sidebar allows users to navigate between major sections of the system.
- Filters Section (3)
 - This section allows users to filter historical records.
 - When the Apply Filter button is clicked, the table updates to match the selected filters. Reset clears all filter selections.
- Search Bar (4)
 - Allows users to search for specific transactions using keywords such as item name or transaction ID. The search dynamically filters matching records.
- History Table (5)
 - Displays detailed transaction history records. Each row represents one transaction in the system.
- Page Controls (6)
 - Allows users to navigate between multiple pages of records if the dataset is large.
- Export Button (7)
 - Allows Managers and Accountants to export filtered history records as a CSV file for reporting or auditing purposes.

The home page acts as the main dashboard of the application. It provides an overview of inventory activity and allows users to navigate to other parts of the system depending on their role.

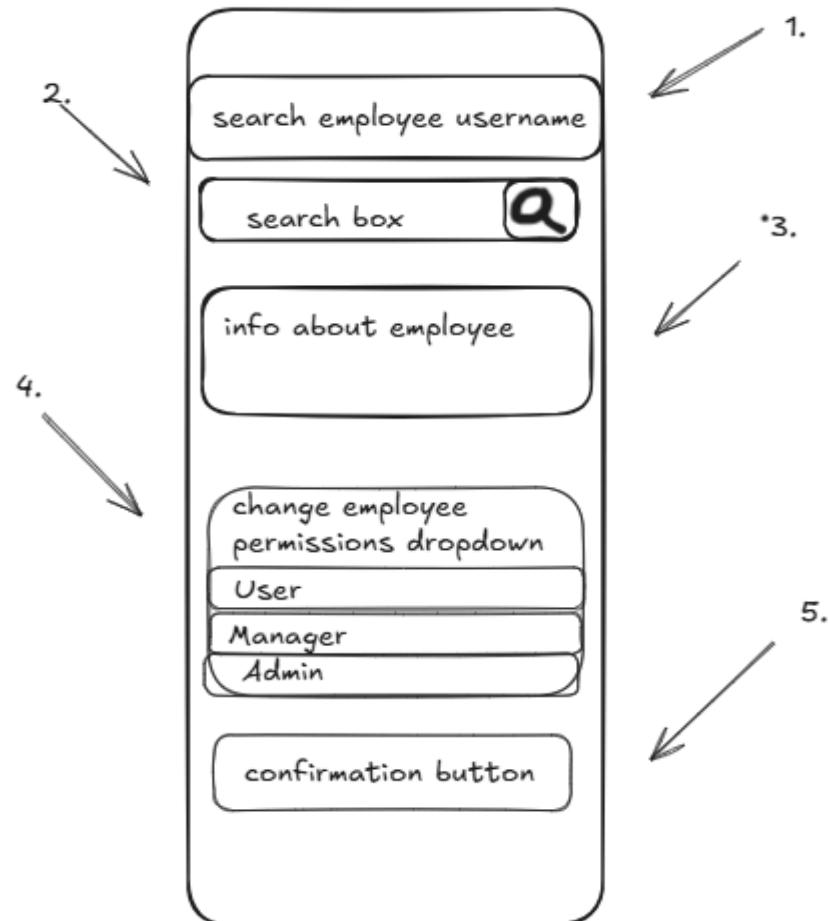

- Top Navigation Bar (1)
 - The top navigation bar contains the application logo, the logged-in user's profile dropdown, and a logout button.
- Sidebar Navigation (2)
 - The sidebar allows users to navigate between major sections of the system.
 - Managers and Accountants may see additional options compared to Employees
- Summary Cards (3)
 - This section displays key inventory statistics in card format for quick viewing.
 - Total Inventory Items (3a): Displays the total number of items currently stored.
 - Low Stock Items(3b): Displays how many items are below a minimum threshold.
 - scheduled Deliveries(3c): Displays upcoming shipments that are scheduled.
 - Total Inventory Value (3d):displays the total monetary value of inventory.
- Recent Activity Table (4)
 - This table displays the most recent inventory-related actions. This allows users to quickly monitor recent system activity.
- Quick Action Buttons (5)
 - This section includes shortcut buttons. Clicking "View Inventory History" redirects the user to the Inventory History page. Export Summary allows Managers and Accountants to download a report.

**User Profile Page:**

1. Display the username of the user
2. Display the email of the user
3. A button to reset the password of the user will send an email to change it
4. Display the permission level, Delivery, Regular user, Admin
5. Ssn of the user
6. Option to punch in or out
7. Sends the user back to the homescreen

Purpose: to show the users' information about their profile if they need to reference it.

Employee Management Page

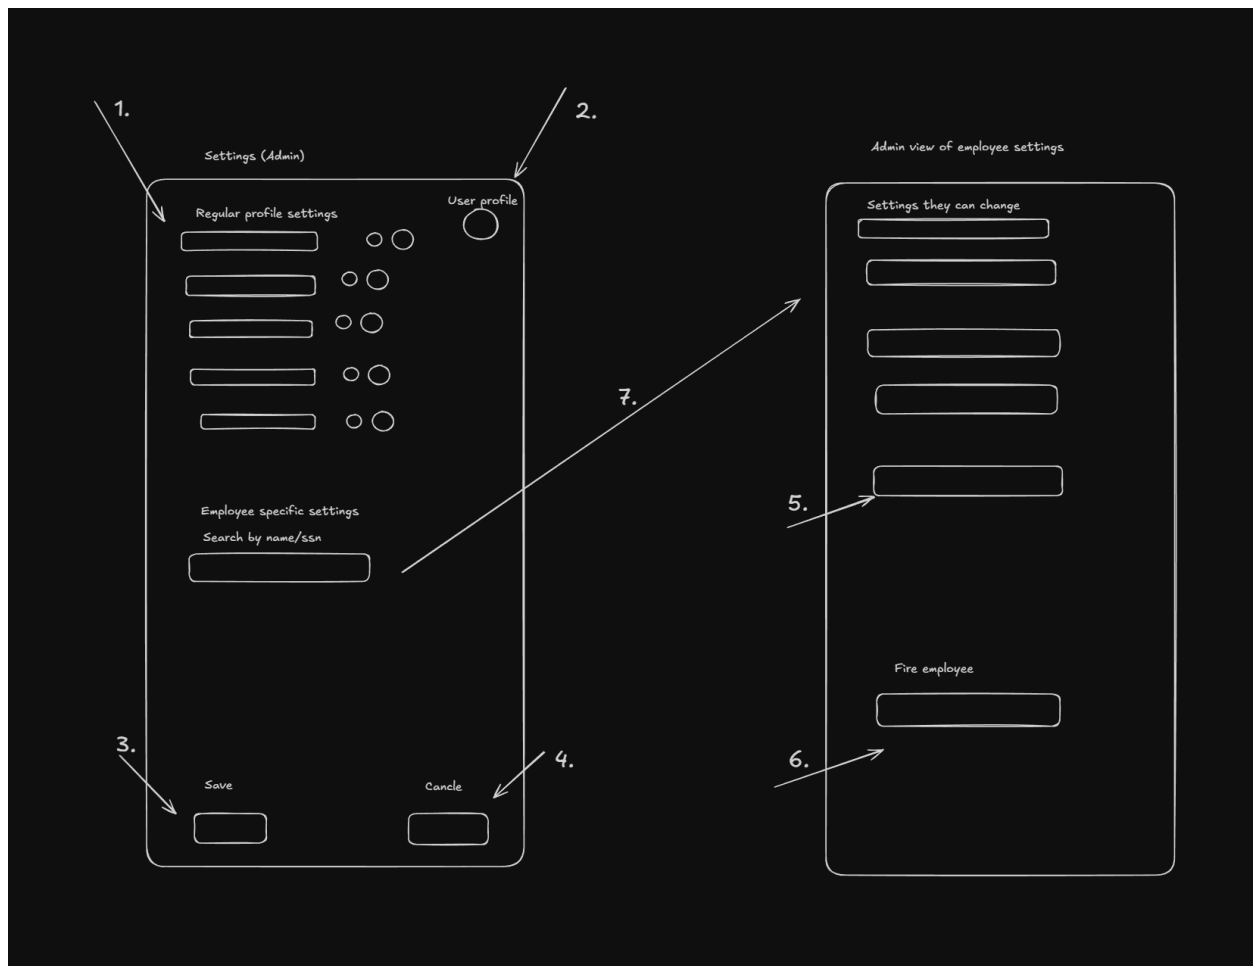

Employee Management Page:

1. Search title for employee management page
2. Search box for searching up an employee, clicking the magnifying glass will execute the search. While they are searching, it will try to autocomplete matching employee surnames.
3. Displays info about the employee, username, current permissions, email, etc.
4. A dropdown menu to choose what the new permissions will be, executed when the confirmation button is pressed
5. Confirmation button to execute the desired change to the target employees' permissions

Purpose: For company admins to search and manage users on the app.

User Settings - Eli Johnson

**Actors**

- **Employee and Admin:** Both employees and admins can see their user settings, although admins can access employee setting to change things like access permissions or remove an employee

Fields

- **User settings(1):** The setting for the user that they can change (username, password, etc.)
- **User Profile(2):** The profile of the user who is changing their settings
- **Save and Cancel(3/4):** Buttons to save changes or cancel them
- **Search for an Employee(Admin only, 7):** An admin specific feature that allows them to search for an employee and change their specific settings (5) and potentially remove them from the database (6)

Delivery Management page

1. Day selector

--	--	--	--	--	--	--

2. Incoming deliveries

item coming in	Company

3. Outgoing deliveries

item going out	Company

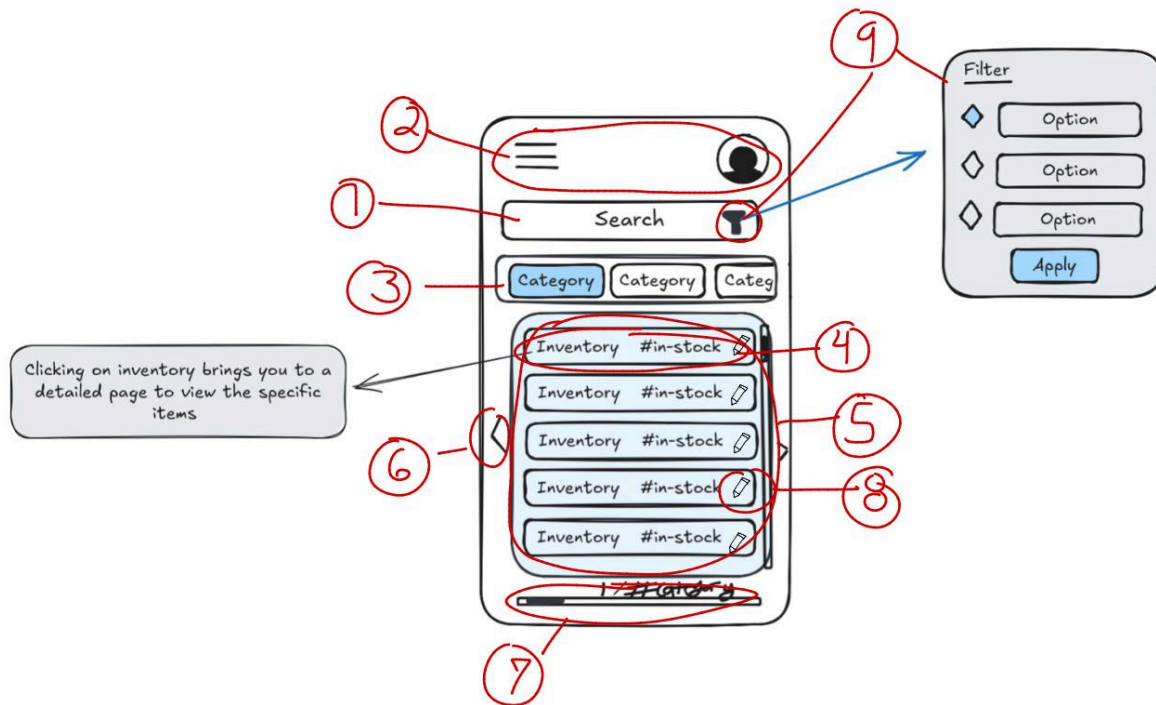

Actors

- Admin only

Fields

- **Day selector(1):** Allows the admin to change the day they are looking at to any day of the current working week
- **Incoming/Outgoing(2/3):** Shows the incoming and outgoing items and which companies are picking them up and dropping them off

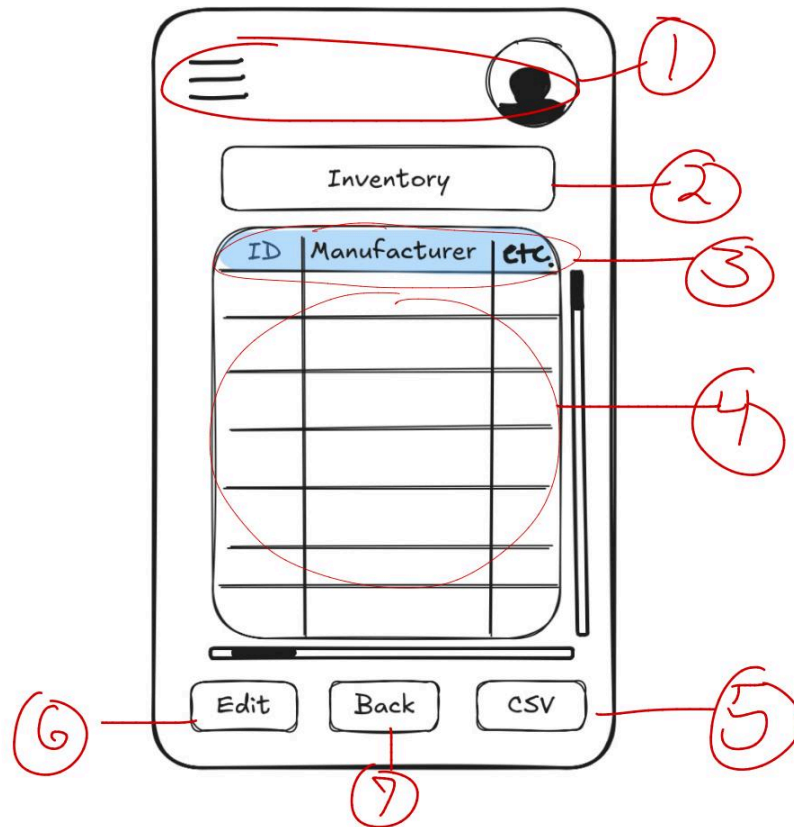

Search Inventory - Olivia Blais

The search inventory screen allows users to navigate the inventory with ease. If you wish to leave the page, you can use the drop-down menu or the profile icon at the top (2) of the screen. The search bar (1) allows users to search for a certain item or inventory type. In the case the user needs to search for items with certain attributes, they can search using filters (9) by clicking the filter icon located to the right inside the search bar.

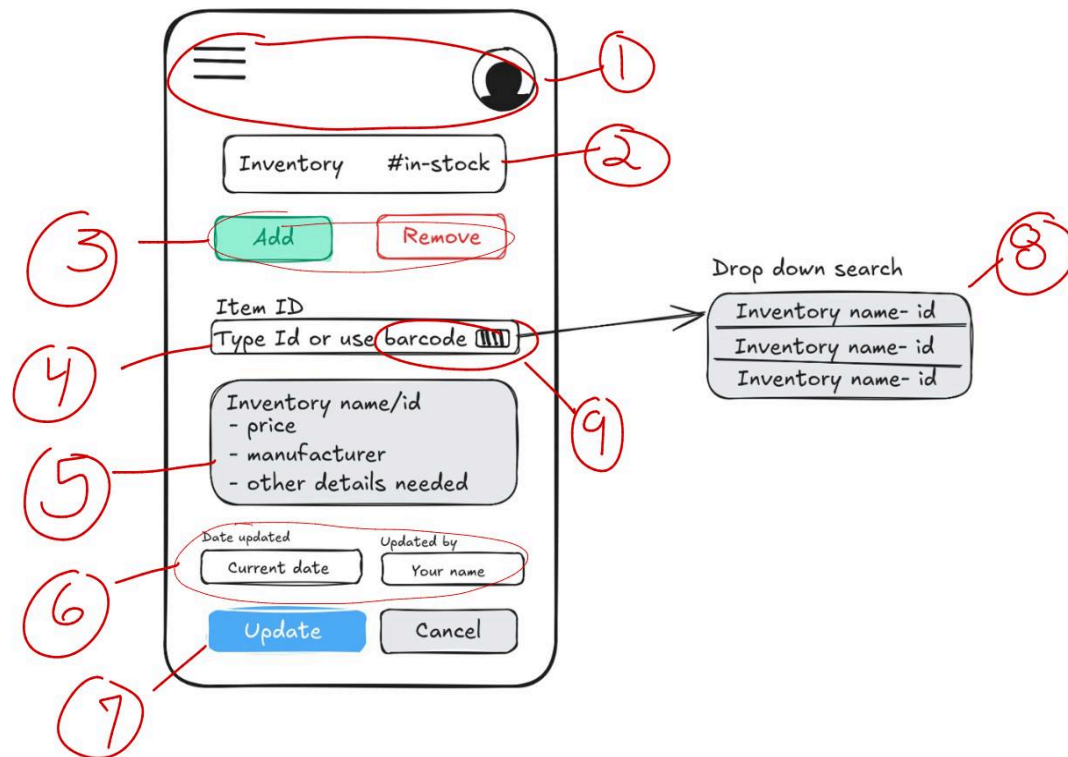

Below the search bar are the different categories of inventory (3), both set by the filter or set up by the manager, which will then be displayed in a list format (5) below. You can navigate to different categories by either clicking on the category name in (3) or by using the side arrows (6) to scroll left and right. Number (7) will tell you where you are in relation to the number of categories set. Once you find the Inventory type you wish to monitor, you have a couple of options: you can either edit it via the pencil icon (8) or click on the inventory (4) to view a more detailed list of the items within that inventory type.

View Inventory items- Olivia Blais

The view inventory page allows for easy navigation to the other app pages via (1) the drop-down menu and profile icon. In order to head back to the page you were previously on, you can use the (7) back button. The inventory page will display the type of inventory you are viewing (2) above the table of items (4). The items each have different attributes (3) shown at the top of the table view. From this page, you can edit the current inventory by navigating to the add/remove screen via the (6) edit button. If the user needs a csv file of the data, located at the bottom will be a (5) button named csv which will allow the user to download the file to their device's local files.

Add/Remove Inventory - Olivia Blais

The add/remove inventory screen provides users, such as employees and admins, with the ability to modify the current inventory. At the (1) top, you have the drop-down and user profile for navigation to other screens in the app. Below should be (2) the bar providing the inventory type and the number of such items in stock related to the category.

The user then (3) chooses if the action they wish to perform is to add or delete inventory. There are a few options to choose the inventory you wish to perform your action on. The user can (4) manually type the inventory id, (8) select the item from the drop-down of the search bar, or (9) use the barcode option. If the inventory is a current item, (5) the item's attributes will be listed below. If the item is new, in the same place (5), you add the attributes to the item in their related fields.

The date and the user (6) who is updating the inventory will show at the bottom of the screen. It will default to the current date and the name associated with the user's account. When the employee or admin is ready, they can hit the (7) update button. If that data needs to be changed and the user is not an admin, they will need to notify the admin to edit it.
